Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	3 Marks

Problem – Solution Fit

This project demonstrates how to implement a script-controlled Access Control List (ACL) in ServiceNow to restrict users from accessing records unless they meet specific conditions. The system evaluates the user's role and the **Branch** field value before allowing access. EEE branch users can view EEE branch records, while administrators have full access. Separate ACLs are also used to control **read, create, write, and delete** operations based on assigned roles.

Purpose:

- ☐ Restrict unauthorized users from accessing sensitive records.
- ☐ Control record access based on user roles and Branch field values.
- ☐ Provide different permissions for READ, CREATE, WRITE and DELETE operations.
- ☐ Allow administrators to retain full access to all records.
- ☐ Improve record-level security by evaluating user roles and field values together.
- ☐ Prevent unauthorized viewing, modification, creation and deletion of records.

Template:

Define CS, fit into CS	1. CUSTOMER SEGMENT(S) CS Who is your customer? i.e. working parents of 0-12 year kids ServiceNow administrators; EEE branch users; users assigned bb1, bb2, bb3 and bb4 roles.	6. CUSTOMER CONSTRAINTS CC What constraints prevent your customers from taking action or limit their choices or decision? i.e. spending power, budget, no cash, network connection, available devices. - Users must have the correct role and access conditions. - Incorrect role assignment or branch conditions can block or expose records.	5. AVAILABLE SOLUTIONS AS What solutions are available to the customers when they face the problem or need to get help? i.e. pen and paper, digital or online tools. ServiceNow ACLs, role-based access control, data conditions, and script-controlled ACL rules.	Explores AS, fit into AS
	2. JOBS: TO-BE-DONE / PROBLEMS J&P Which job-to-be-done (or problems) do you address for your customers? i.e. the real need, pain points, goals. Restrict users from viewing records unless they meet specific conditions. Control create, write and delete operations for authorized users.	9. PROBLEM ROOT CAUSE RC What is the real reason that this problem exists? What is the back story behind the need to do this job? i.e. customers have to do it because of the change in regulation. Basic permissions alone do not enforce field-level branch restrictions. Records need role and Branch values to be evaluated together.	7. BEHAVIOUR BE What does your customer do to address the problem and get the job done? i.e. directly related, not the right solution yet. Indirectly associated, customers spend free time on volunteer work (i.e. Greenpeace). Users log in and request record access. Administrators configure roles and ACLs. Authorized users access permitted records; others are denied.	
Identify TR & EM	3. TRIGGERS TR What triggers customers to act? i.e. seeing their neighbour installing solar panels, reading about a more efficient solution in the news. A user opens the Student Records list, requests access, or performs a read/create/write/delete operation.	10. YOUR SOLUTION SL If you are working on a new business proposition, then keep it brief: blank. i.e. the value add, how it solves the problem, key features and benefits. Implement script-controlled ACLs on the Institution Details table. Restrict access based on Branch = EEE; bb1, bb2, bb3 and bb4 control create, write and delete. Admin users retain full access.	8. CHANNELS OF BEHAVIOUR CH What kind of actions do customers take online? Extract online channels from i7 and use them for customer development. ServiceNow web interface: Application Navigator; Student Records list form.	Extract online & offline CH & OF
	4. EMOTIONS: BEFORE / AFTER EM How do customers feel before they face a problem or a job and afterwards? i.e. feel insecure or confident, in control, safe in your communications strategy & design. Before: concern about unauthorized access. After: controlled, role-based record access.		8.2 OFFLINE OF What kind of actions do customers take offline? Extract offline channels from i7 and use them for customer development. Administrative configuration through User Administration, System Definition and System Security.
