

Project Design Phase

Proposed Solution Template

Date	30 September 2026
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	3 Marks

Proposed Solution :

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	ServiceNow records may be accessed by unauthorized users when access is not properly restricted based on user roles and record field values. The project aims to control access to Institution Details records based on the user's assigned role and the Branch field.
2	Idea / Solution description	Implement a Script-Controlled ACL in ServiceNow to control READ, CREATE, WRITE, and DELETE operations. The ACL uses user roles and the Branch value to restrict record access, while administrators retain full access.
3	Novelty / Uniqueness	The solution combines role-based access control with Branch-based record-level security using ACL scripting, allowing access rules to be controlled dynamically for different users and records.
4	Social Impact / Customer Satisfaction	Improves data security by preventing unauthorized users from accessing restricted Institution Details records. Authorized users can access only the records permitted by their roles and Branch conditions.

5	Business Model (Revenue Model)	The project is primarily a security and access-control solution for ServiceNow environments. It can be used as part of enterprise ServiceNow implementation, customization, and security services.
6	Scalability of the Solution	The ACL-based approach can be extended to other ServiceNow tables, roles, fields, departments, and access conditions without changing the overall access-control approach.
